

Completion Reporting Workflow - Montana RASS

Phase 4 deliverable. Describes how CertReady reports passing students to Montana CARD's verification database (svc.mt.gov/dor/liquorserver).

Trigger

A completion record is created when a student passes the final exam ($\geq 80\%$). The internal record includes:

- Student first name, middle initial (if any), last name
- Date of birth
- Course slug (`mt-alcohol` or `mt-alcohol-offsale`)
- Course type ("On-Premises" or "Off-Premises") for the report
- Completion date (UTC timestamp of exam pass)
- Expiration date (3 years from completion per MCA 16-4-1005)
- Unique cert / verification number (CRMT prefix + 8-digit sequential, e.g. `CRMT00000001`)
- Final exam score
- Provider identifier ("CertReady - Practical AI Solutions LLC")

Internal storage

Each cert lives in our `certificates` table (Supabase Postgres) with full audit trail. The `reportable_completions` view exposes the joined cert + student profile data needed for the state report.

Reporting cadence

Regulatory ceiling: within two weeks of each completion. Per ARM 42.13.904 (adopted via MAR Notice 2025-292.3 (adopting the amended proposal in MAR Notice 2025-292.2), effective 2026-03-07), RASS-approved private providers must submit training records electronically to CARD within two weeks of each completion via the CARD-approved secure electronic process.

CertReady's automated cron checks for unreported certs daily and emails an internal alert when records are ready to file. An admin uploads the file via the trainer portal at least every two weeks (and more frequently in practice — typically weekly — so we stay well inside the regulatory ceiling). Reporting more frequently than the two-week ceiling is fully compliant.

Once Kent Haab confirms the trainer-portal API or an accepted near-real-time feed mechanism, the cron will switch from human-mediated upload to automated submission, while staying inside the same two-week ceiling.

Reporting format

CSV via the trainer portal at <https://svc.mt.gov/dor/liquorserver/Default.aspx>. Provisional schema (to be confirmed with Kent before going live):

Column	Source	Example
LastName	<code>profiles.last_name</code>	Smith
FirstName	<code>profiles.first_name</code>	Sarah
MiddleInitial	<code>profiles.middle_initial</code>	M
DOB	<code>profiles.date_of_birth</code>	1995-03-15
CourseType	derived from <code>courses.slug</code>	On-Premises
CompletionDate	<code>certificates.issued_at</code>	2026-05-15
ExpirationDate	<code>certificates.expires_at</code>	2029-05-15
CertNumber	<code>certificates.cert_number</code>	CRMT00000017
ProviderName	constant	CertReady (Practical AI Solutions LLC)
Score	<code>certificates.exam_score</code>	92

The CSV adapter is implemented at `app/src/lib/reporting/mt-csv.ts` . It is registered in `app/src/lib/reporting/registry.ts` and selected automatically when an admin runs `/admin/reports?state=MT` .

Silo isolation guarantee

The reporting route filters by **course_id** (not just `state_code`) before passing rows to the adapter. Each adapter only ever sees rows from its own state's courses, so a misconfigured row from another

course can never leak into Montana's report. A unit test in `app/scripts/test-reporting-isolation.mjs` locks this in and is run before each platform release.

Marking sent

When the admin uploads the CSV to the trainer portal, the `/admin/reports` POST endpoint marks every cert in the file with:

- `reported_to_state_at = NOW()`
- `state_confirmation_id` = the trainer-portal confirmation number, if returned

These rows are excluded from the next report file. An audit log entry is written for the marking action with the admin's ID, the count of certs reported, and the confirmation ID.

Error handling

If a portal upload fails (network error, schema mismatch, validation error), the certs are NOT marked sent and they roll into the next file. An internal alert email goes to ops@certready.org.

Record retention

Provider record retention: 5 years (CertReady policy, exceeds the practical audit horizon).

Records retained:

- Every `enrollment` (immutable)
- Every `module_progress` row (per module per student)
- Every `quiz_attempt` (full answer history)
- Every `exam_session` (full answer history, scoring method, pass/fail)
- Every `certificate` (cert number, score, issued_at, expires_at, reported_to_state_at, state_confirmation_id)
- Every `event` (audit log of state changes)

All records are producible on reasonable notice from CARD. The `/admin/reports` route can be filtered by date range to produce historical reports if a CARD audit covers a back-period.

Test submission

A test submission can be requested by emailing CertReady ops. We will generate a CSV against the provisional schema above (or whatever schema Kent confirms) and email it for review before the first live filing.
